

LOOK! No Hand Rail

Sky Glass has been engineered to meet balustrade safety regulations without the need for a hand rail.

The 2006 revision of AS1288 deemed the 12mm frameless toughened glass balustrade unsafe in applications over 1m off the ground due to the risk of breakage exposing people to falls. Since then, designers have been forced to use unsightly load bearing handrails.

After two years of research and development Bevelite Glass now offers Sky Glass as a solution to the demand for frameless balustrades.

Sky Glass will remain intact even when shattered. It will not slump or fall from the opening.

Utilizing innovative processing techniques and interlayer technology, Sky Glass offers superior performance:

- + stronger and tougher
- + superior edge stability, no delamination
- + designers can be confident using Sky Glass in external, coastal, residential and even the most demanding commercial applications
- + designers can meet aesthetic requirements without compromising safety
- + in-house engineering support and letters of compliance provided
