Zinc is a natural element of our environment. It takes very little energy to manufacture compared to other metals used in equivalent building envelope applications. Rolled zinc is unique in that it reacts to the main components of the atmosphere by creating a self-protective coating. Thanks to the latter, zinc can easily last a hundred years. Rolled zinc is also 100 % recyclable and 95% of it is effectively recovered and re-used in different areas of application.

With VMZINC solutions you can dare to be creative and make a mark without marking the environment.
